TROSIFOL EXTRA PROTECT blocks UV Light

Invisible to the human eye, ultraviolet (UV) light is as vital as it is hazardous. While a certain degree of exposure is beneficial, too much of this part of the spectrum of natural sunlight is harmful.

Conventional window glass is impermeable to UV light below 320 nm. PVB films between glass plies filter out further UV light. TROSIFOL® EXTRA PROTECT is a new PVB film that blocks out incidental UV light in its entirety (>99%).

FURTHER INFORMATION

UV-protection agent UV-328

Virtually all TROSIFOL® PVB films and SentryGlas®* ionoplast interlayer for applications in architectural and PV SOLAR safety glazing (with the exception of TROSIFOL® UV+) contain a UV protection agent. The substance used until now - a so called benzotriazol (UV-328) - is in a concentration slightly higher than that classified as subject to labelling by the European Chemicals Agency under the REACH Regulation.

We will modify the safety data sheets accordingly. In addition we plan to replace this product with a different UV protection agent. We will inform you immediately after the replacement. The existing specified product properties will remain unchanged.
